Queensland:
Young Risky Drinkers’ Most Recent
Risky Drinking Session

We asked what a drinking session looked like

One in five Australian 14-19 year olds drink at levels considered to be putting them at risk of injury at least once a month (1).

The heaviest teenage drinkers tend to disproportionately experience more alcohol related harms while being underrepresented in many health surveys which examine the Australian population as a whole.

This study, the Young Australians Alcohol Reporting System (YAARS), aimed to investigate the drinking occasions that were associated with a risk of harm.

We were interested in the most recent occasion when a teenager drank more than what the national guidelines describe as lower-risk. We asked questions such as how much they drank, where they drank, the types of beverages they had, and about some of the outcomes of this drinking.

We asked about these experiences to determine which factors contribute to, or protect young people from alcohol related harms.

The 14-19 year old participants were amongst the riskiest drinking 25% of their age-bracket

Risky drinking teenagers were surveyed all over Australia

In 2016 and 2017 we conducted over 3,400 face-to-face interviews and online surveys with young people aged 14-19. This bulletin presents the findings from our 172 Queensland based teenagers (91 face-to-face interviews and 81 online surveys).

The participants represented the riskiest drinking 20-25% of their age-bracket (most were consuming 5+ standard drinks in a single session, at least twice a month).

Participants were recruited through social media advertising, peer-referral, and posters at educational facilities and services frequented by young people.

This study is not representative of 14-19 year old drinkers. Our sample are, by definition, a minority subset who engage in the riskiest drinking. Please refer to our other publications for further information on the project’s methods, and comparisons with age-matched groups recruited using representative sampling techniques (2).
Where did they drink?

- A friend’s home (67%)
- Their own home (21%)
- A bar or pub (15%)
- Club (12%)
- Music festival or concert (2%)

- Most (87%) drank in at least one non-licensed location such as a home, car, park or beach during their session

When did they drink?

- Two-thirds of participants (65%) described this drinking session as occurring 7 or fewer days ago and 83% reported it occurred 14 or fewer days ago
- Two thirds of the drinking sessions were held on Fridays (27%) or Saturdays (43%).
- The first drink was most commonly consumed in the early evening (27% from 6-6.30pm, 37% from 7-8.30pm), and the last drink around midnight (32% 10-11.30pm, 32% midnight-1.30am, 20% 2-3.30am).
- The drinking session ran for an average of 5.7 hours (CI95: 5.2, 6.2).

Popular beverage types

The most popular drink types were spirits (73%), beer (45%), pre-mixed drinks (33%), wine (28%) and cider (18%). Females were more likely to report drinking pre-mixed drinks, wine, cider and liqueurs or cocktails than males. Males were more likely to report drinking beer.

![Figure 1: Beverage types consumed at the last risky drinking session for Queensland YAARS participants](image-url)
One-third were involved in “pre-drinking”

Older participants were more likely to pre-drink (p<0.01) and 18-19 year old girls were more likely to pre-drink than boys of the same age (p<0.05). For younger participants, there were no significant gender differences in pre-drinking.

![Figure 2: Proportion of Queensland participants who pre-drank on their last risky drinking occasion](image)

**How much did they drink?**

Males drank more than females and older respondents drank more than younger respondents.

![Figure 3: Average alcohol consumption at the last risky drinking session by age, gender and survey administration modality](image)

**Alcohol-related outcomes from this drinking session**

Harms reported to have occurred as a result of this drinking session included:

- Having a hangover (40%)
- Having less energy or feeling tired because of my drinking (30%)
- Saying or doing embarrassing things (28%)
- Feeling very sick to my stomach or throwing up after drinking (18%)
- Being injured due to my drinking (including cuts & bruises; 18%)
- Needing larger amounts of alcohol to feel any effect (16%)
- Finding it difficult to limit how much I drank (14%)
- Not being able to remember large stretches of time while drinking heavily (12%)
- Doing impulsive things I regretted later (10%)
How did they try to keep safe?

We asked about protective strategies used to reduce alcohol consumption or to limit alcohol-related problems. These behaviours can limit alcohol-related problems even after controlling for the quantity of alcohol consumed (3). The safety strategies most closely related to limiting experience of alcohol-related problems were those related to quantity reduction - when the individual was ‘determined not to exceed a set number of drinks’ (17% always or usually did this) or when they ‘avoided trying to keep up with or out-drink others’ (27% always or usually did this).

Table 1: Safety strategies ‘always’ or ‘usually’ used while drinking during the past 12 months

The Young Australians Alcohol Reporting System is a project led by the National Drug Research Institute (NDRI; Curtin University, WA) in collaboration with their partners at the National Drug and Alcohol Research Centre (NDARC; University of New South Wales), Eastern Health Clinical School (Monash University and Turning Point; VIC), The University of Tasmania, Flinders University (SA), ACT Health, Charles Darwin University (NT), and the University of Queensland. This study was funded by the Australian Government’s Department of Health and Ageing (grant D16-451850) to promote good health in general, with an emphasis on young people. For further information contact Dr Tina Lam at the National Drug research Institute on +61 8 9266 1600 or tina.lam@curtin.edu.au
